

Professionals always finish the job

Here's what the Pro's already know... ...that the motorist needs to know

Re-using old mounts is risky business. That's because the effects of age can't always be seen. Anyone can spot obvious damage but it takes a pro to understand that rubber components become denser and more brittle over time. An old mount will transmit more vibration and noise. What looks OK today... may not be, tomorrow. And of course, no one likes to do the job twice.

Advantages of replacing Strut Mounts:

- ✓ Front Mounts often include the steering pivot bearing.
- ✓ Reduces noise and vibration.
- ✓ Restores ride height.
- ✓ More accurate wheel alignment.

Did you know?

Reusing old Strut Mounts is the #1 cause of "Clunking Noises" and Strut job comebacks!

KYB has a reputation for providing the highest quality strut mounts in the industry.

Don't take a risk. Your reputation is on the line too!

Replace strut mounts and boots every time you replace struts

Strut's #1 Enemy? ...Dirt!

Protect your new struts from dirt, dust, sand, salt and other harmful elements

Rapid, premature strut wear is often caused by damage to the strut's upper seal and polished shaft. Debris acts like fine sandpaper and quickly wears away critical rubber and polished parts. The result? Leaks, wear and an unhappy customer.

Do you know what the included polyfoam part is?

The travel-limiting bumper!

Suspension Struts use an external cushion for damage protection during extreme driving events.

Replacing strut boot kits:

- ✓ Keeps dirt, dust, salt and sand away from the strut shaft.
- ✓ Protects the strut seals
- ✓ Prevents the strut from bottoming out with the included protective bumper.

Damage, Dirt or Corrosion here will cause oil seals to fail and leak.
